ACCESSLEARN · PRESENTATION SCRIPT

A GUIDED WEBSITE DEMONSTRATION

Learning that makes room for everyone.

A timed, speaker-ready walkthrough of AccessLearn's inclusive learning experience for students and educators.

CORE IDEA

Bring lessons, accessibility tools and educator support together in one learning platform—so students can engage in the way that works best for them.

Run time	Format	Audience
About 5 minutes	Talk + website demo	Project / product review

Use the italicized demo cues to navigate the site while you present. Spoken text is ready to read aloud.

01 · OPENING

Start with the learner

Welcome

0:00–0:40

“Hello, and thank you for being here. Today I’m presenting AccessLearn, an inclusive learning website designed to make digital study more flexible for students and more manageable for educators. The idea is simple: learning content should not be one-size-fits-all. Some students learn best by reading, some by listening, and some need clearer language, larger text or fewer distractions.”

> **On screen:** Open the login page and introduce the two role-based entry points: Student and Admin / Educator.

The student home

0:40–1:15

“A student enters a focused learning space rather than a crowded portal. The dashboard brings the daily learning path, lesson progress and useful learning links together. From here, a student can continue a lesson, explore the lesson library, choose an audio-first resource, or look for scholarship and accessibility support.”

> **Demo:** Sign in through the student entry and show the dashboard, then open My Lessons or Daily Path.

Presenter note: The frontend includes demo mode and sample content so the interface can be demonstrated without a live backend. Describe dashboard figures and sample lessons as demonstration data unless you have confirmed they are live.

02 · ACCESSIBILITY IN ACTION

Show, don’t just tell

The lesson experience

1:15–2:15

“Here is a lesson on Newton’s First Law. The student can read the explanation, increase the text size, switch to a simpler explanation, or use the browser’s read-aloud voice. Across the learning area, focus mode and visible keyboard-focus styling help reduce distractions and make navigation easier. These tools let the learner adjust the experience instead of having to adapt to a single presentation style.”

Demo: Open the lesson. Show Read aloud, Simple mode and T+ text sizing. If time permits, turn on Focus mode from the page toolbar.

Learning support and audio

2:15–2:55

“The lesson view also includes Sahayak AI support and suggested ways to ask for help, such as requesting a simpler explanation or a real-life example. The site has a separate audio library for students who prefer listening. The wider chat widget is configured to connect to an n8n workflow; for a live demonstration, I’ll confirm the chat service is available before presenting its response as live.”

Demo: Show the lesson’s Sahayak panel and Audio Library. If the configured chat service is offline, show the interface and continue without waiting on it.

Support beyond lessons

2:55–3:20

“Students can also explore scholarship and accessibility schemes, and set preferences such as language and primary support. The goal is to connect learning with practical next steps—not only to present lesson material.”

Demo: Briefly show Scholarships, then the learning profile preferences.

03 · THE EDUCATOR EXPERIENCE

One platform, two perspectives

Tools for educators

3:20–4:05

“AccessLearn also has a separate educator and administrator experience. The command centre brings together student inclusion and progress views. Educators can prepare reading content, upload audio or video lessons, and access classroom and exam-management screens. The purpose is to support the teaching workflow alongside the student experience.”

> **Demo:** Switch to the educator entry. Show the Command Centre, then point out Reading Content, Upload, Classroom, Exam Management and Inclusion Roster. Don’t submit an upload during a short presentation.

Assessment and implementation

4:05–4:35

“The Exam Hall demonstrates question navigation and a set of accessibility controls, including read-aloud, simpler language, larger text and focus mode. Under the interface, the frontend is built with React, TypeScript and Vite. The wider project includes an Express and Node.js backend with MongoDB and Mongoose, along with media and learning-content routes.”

> **Demo:** Open the Exam Hall and point to the question map and accessibility tools. Mention that backend-dependent features need the API and database configured.

Honest demo framing: Some student screens intentionally fall back to sample data, and the project has a demo mode. Live sign-in, stored content, uploads and other API-backed behavior depend on correctly configured backend services.

04 · CLOSE AND PREPARE

End on the purpose

Closing

4:35–5:00

“To summarize, AccessLearn brings accessible lesson delivery, flexible study tools and educator workflows into one experience. Its central principle is that accessibility is not an extra setting hidden away—it is part of how students learn and how educators support them. This project is a foundation that can grow through real classroom feedback, reliable service integrations and more inclusive content. Thank you. I’m happy to take your questions.”

> “Accessibility is not an extra setting—it is part of the learning experience.”

Before you present

- ✓ Start the frontend and open the login page before the audience arrives.
- ✓ Confirm demo mode or live backend mode, and prepare the appropriate role entry.
- ✓ Test the Sahayak chat connection and any audio/video you plan to play.
- ✓ Keep a short route: Dashboard → Lesson → accessibility controls → Admin view → Exam Hall.
- ✓ Use a prepared demo account; never display secrets or private environment settings.

Likely questions

Who is AccessLearn for?
Students who benefit from flexible and accessible learning, and educators who manage inclusive content and classroom workflows.

What accessibility features can you show?
Read-aloud narration, simplified lesson mode, text scaling, focus mode, keyboard focus and accessible labels.

Is every screen connected to live data?
Not necessarily. The frontend supports demo/sample data; live behavior depends on API, database and chat configuration.

Tip: If you need a longer presentation, expand the lesson and educator demonstrations rather than claiming integrations or data are live before checking them.
